Araruama, RJ, Brazil | UTC-3 | available for remote work - full overlap with US time zones, partial with Europe

Rate expectation: ~US\$ 12-13/h (CLT-equivalent) or ~US\$ 16-18/h (PJ/contractor)

ABOUT

Software engineer with almost 7 years of experience, focused on Java/Spring Boot back-end work with full-stack delivery in React and Angular (JS/TS). I've designed and delivered microservices architectures processing millions of daily transactions, across SQL and NoSQL databases and cloud platforms (Azure, AWS, GCP). I embrace AI-assisted development with Spec Driven Development (Cursor, Claude Code).

Domains: loyalty programs (Vivo Valoriza), e-invoicing and tax compliance (InvoiceCon/Cast Group and Luizalabs, Brazilian tax reform), agribusiness quality inspection, public safety monitoring, and web reporting (Canal Telecom).

PROFESSIONAL EXPERIENCE

Senior Full Stack Java Developer

Zukk Tecnologia | *Remote* | Contract — client: Vivo/Telefónica | Nov 2025 – Jun 2026

- Refactored the Vivo Valoriza web administration system (the benefits program within Vivo's app), modernizing a distributed architecture with Java microservices, a BFF (Backend for Frontend) layer in Nest.js, and React micro front-ends.
- Adopted Spec Driven Development with AI agents (Cursor and Claude Code) and the Superpowers plugin, applying brainstorming, plan-writing, and plan-execution workflows to increase delivery predictability and quality.
- Drove the delivery cycle on Azure DevOps — Boards for planning, Repos for version control, and Pipelines for CI/CD — and switched between the Zukk and Vivo environments to pull Vivo's legacy code and refactor it inside the Zukk environment.

Architecture: Java microservices exposed through RESTful APIs and consumed by React/TypeScript micro front-ends via a BFF layer in Nest.js; tested with JUnit, Mockito and Jest; hosted on Azure with Azure SQL, delivery cycle in Azure DevOps and version control in Git. Specification and implementation driven by Spec Driven Development with Cursor and Claude Code.

Full Stack Java Developer

Cast Group | *Remote* | Aug 2025 – Nov 2025 (3 months)

- Worked on InvoiceCon, an electronic invoicing (NF-e) solution, with Java Spring on the back-end and Angular on the front-end, contributing to the system's migration to the new rules of the Brazilian Tax Reform.
- Ran the solution on Microsoft Azure, using Azure SQL for fiscal data and Blob Storage for invoice document storage, with build and deployment automated through GitLab CI/CD.
- Worked on SAP integration operations and client version upgrades, in a system with rigorous version control.

Architecture: Java back-end with Spring serving RESTful APIs over SQL, with SAP integration; Angular/TypeScript front-end. Quality checked with JUnit, Mockito and SonarQube. Solution hosted on Azure, with Azure SQL for the tax data and Blob Storage for the documents, shipped through GitLab CI/CD from Git.

Full Stack Java Developer

Luizalabs (Magazine Luiza) | *São Paulo, SP* | Jul 2024 – Apr 2025 (10 months)

- Developed financial microservices in Java Spring Boot/MVC with JWT and Keycloak authentication, processing millions of daily transactions, and React/TypeScript interfaces for payment declarations (CPF, CNPJ).
- Owned the weekly on-call rotation, resolving N3 support tickets and critical production incidents; sustained ~95% code coverage with JUnit, Mockito, and SonarQube.
- Built RESTful APIs with Apigee/API Gateway (OpenAPI) and maintained data pipelines with Python, Apache Spark, and Apache Airflow, including repopulating the data lake from Oracle EBS.
- Optimized batch invoice processing with Virtual Threads (Java 21), cutting the import of ~100k records from several minutes to about one minute.
- Had hands-on exposure to RabbitMQ, used on the team for manual reprocessing of failed messages in the queue.

Architecture: Financial microservices in Java 21 and Spring Boot/Spring MVC, with Hibernate over Oracle Database and Virtual Threads in batch processing; JWT and Keycloak authentication, exposure through Apigee and queue reprocessing in RabbitMQ. React/TypeScript front-end. Tested with JUnit, Mockito, Jest and SonarQube. Data pipelines in Python with Apache Spark and Apache Airflow. Deployed on Docker and Kubernetes via ArgoCD, observed in Grafana, over GCP and Magalu Cloud.

Full Stack Java Developer

PariPassu | Florianópolis, SC | Aug 2022 – Apr 2024 (1 year and 9 months)

- Architected and developed CLICQ, a food quality inspection system covering the entire supply chain (from producers to retail), with a Spring Boot backend and a React/Redux/TypeScript frontend, plus legacy versions in AngularJS, Angular 8/Ionic, and mobile in React Native.
- Built a churn prediction tool with Machine Learning (Python), accessible via a Discord bot, reducing customer churn by 18%.
- Owned the weekly on-call rotation, preventing and fixing defects with N2 support, Grafana monitoring, and manual testing; there was no automated test suite, but we kept a strict code review policy — no code shipped to production without approval from two reviewing peers.

Architecture: Java back-end with Spring Boot and jOOQ over PostgreSQL, documented in Swagger; React/Redux/TypeScript front-end, with legacy versions in Angular and Ionic and mobile in React Native. Churn prediction in Python with Machine Learning. Infrastructure on AWS (EC2, S3, RDS), with builds in Jenkins, monitoring in Grafana and planning in Jira.

Full Stack PHP Developer

Department of Public Safety | Florianópolis, SC | Oct 2020 – Jul 2022 (1 year and 10 months)

- Developed the Bem-Te-Vi App PWA in React and Leaflet, featuring an interactive map of nearly five thousand security cameras across Santa Catarina, with live viewing and recording downloads for state police officers.
- Maintained legacy public safety systems (Bem-Te-Vi and BRAVO) in PHP with LDAP authentication.
- Used RabbitMQ for asynchronous SMS processing of monitored license-plate events.
- Integrated Elasticsearch for full-text search.

Architecture: Legacy systems in PHP and Laravel with LDAP authentication, exposing REST APIs over PostgreSQL; PWA in React and JavaScript with maps in Leaflet. Full-text search in Elasticsearch and asynchronous SMS processing in RabbitMQ. Test automation with Selenium and version control in Git.

Junior Full Stack PHP Developer

Canal Telecom | São José, SC | Feb 2018 – Nov 2018 (10 months)

- Developed web reporting interfaces in PHP/JavaScript.
- Took part in a database migration from SQL to NoSQL (MongoDB).
- Maintained the company's backup system, working with Linux/Debian commands (rsync) for backup routines.

Architecture: Web reporting in PHP over Zend and JavaScript, with data in PostgreSQL and MySQL and a migration to MongoDB. Backup routines on Linux with rsync and version control in SVN.

EDUCATION

Bachelor's Degree in Computer Science

Universidade Federal de Santa Catarina (UFSC) | Expected completion: Dec 2026

CERTIFICATIONS

DEVinHouse — Full Stack React & Java program (900h) — SENAI/SC, 2022

Professional, Emotional, and Technological Skills for Times of Change — PUC/RS, 2023

LANGUAGES

- **Portuguese:** native | **English:** professional working proficiency — fluent reading and writing, proficient spoken conversation; used daily for documentation and code review | **Spanish:** basic
